

Marcus Vance

■ Baseball · Right-handed pitcher · 2027 · Session: May 30, 2026

Total Pitches	Avg Velo	Peak Velo	Avg Spin	Max Stress	Healed
12	86.7 mph	92.6 mph	2,229	67.2 Nm	2

Pitch Type Breakdown

Pitch Type	#	Velo	Spin	V Brk	H Brk	Stress
Changeup	2	83.9 mph	1791	10.9"	-14.1"	50.6 Nm
Four-Seam Fastball	4	92.0 mph	2317	18.1"	-6.7"	54.7 Nm
Slider Chase	2	79.0 mph	2374	-4.2"	16.4"	67.1 Nm
Slider Strike-Getter	2	82.8 mph	2397	-2.4"	6.0"	48.1 Nm
Two-Seam Sinker	2	90.2 mph	2181	11.8"	-14.7"	51.2 Nm

Mechanics Critique

What's Working	Areas to Improve
----------------	------------------

✓ **Stiff front leg block.** Avg lead-knee extension at release was 151.7° — near or above the 150° target. *Translates ground force into ball velocity efficiently.*

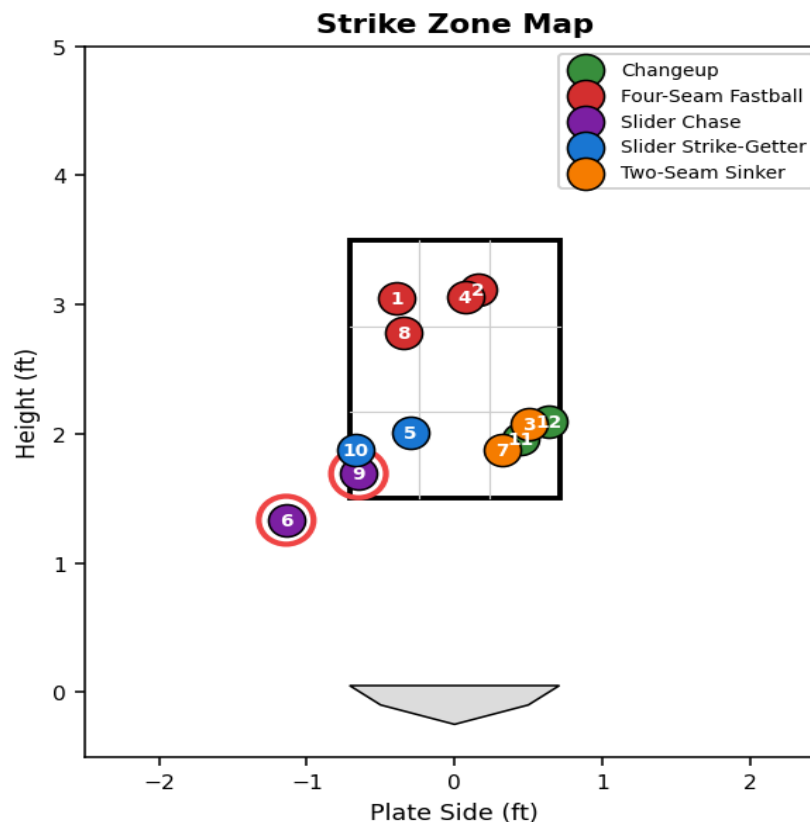

✓ **Strong hip-shoulder separation.** Peak hip-shoulder separation averaged 50.9° — in the upper range for Baseball (50-65°). *Generates rubber-band torque → drives velocity.*

✓ **Trunk stays closed at foot-plant.** Avg trunk rotation at foot-plant was 33.6° — only 9% of pitches opened early. *Protects the elbow AND maximizes power transfer.*

✓ **Explosive trunk rotation.** Peak trunk angular velocity averaged 1157°/sec — in the upper range for HS+ baseball pitchers. *Snappy delivery converts strength into ball velocity at release.*

No corrections flagged — keep it clean.

Strike Zone Map

Numbers = pitch # in session. Green ring = positive outlier (above-average pitch). Red ring = negative outlier (concerning).

■ Injury / Risk Flags

- Pitch #6 (Slider Chase, 79.3 mph) — Elbow stress 66.9 Nm
- Pitch #9 (Slider Chase, 78.8 mph) — Elbow stress 67.2 Nm

Marcus Vance — Action Plan

■ Today — Cooldown (within 30 min of finishing)

Elevated Elbow Stress [Injury Prevention]

Drill: Half-kneeling reverse throws + 7oz plyo decel work

Protocol: 3 sets × 6 reps, 2 min rest between sets. Do today within 30 min of finishing.

Decelerates the arm safely and reduces peak valgus load on the UCL after a high-stress outing.

■ **Reverse Throws — Plyo-Care Routine** — Resilient Performance / PlyoCare

Triggered by: 2 pitch(es) exceeded 62.0 Nm (peak: 67.2 Nm).

■ This Week — Before Next Bullpen

Slider Too Gyro (Bullet Spin) [Stuff — Slider]

Drill: Towel slider drill + grip shift toward middle finger

Protocol: Towel dry reps 5×10 daily. Live grip: middle finger on long seam, index lightly off the ball.

Slider spin efficiency below 30% = mostly gyro / bullet spin / no break. Target 30-40% efficiency for a tight 2-plane break.

■ **Pitching Towel Drill — Throw Gas** — Baseball Pitcher Drills

Triggered by: Slider spin efficiency averaged 24.3% (target: 30-40%).

Slider Grip — Stop Wrist-Twisting [Grip]

Drill: Spike-seam slider grip: ball wedged between thumb pad and middle finger

Protocol: Mirror grip work 5 min daily. 10 spike-seam sliders per bullpen until natural.

High gyro + high elbow stress on the slider usually means you're forcing break with wrist twist. A spike grip lets the ball cut naturally and unloads the elbow.

■ **Slider Grip — Spike-Seam Variation** — PlayBaseball

Triggered by: 2 slider(s) had high gyro and high elbow stress — wrist-twist pattern.
